

Sup

Settlement that proves
delivery without exposing the
trade.

HACKCANTON S3 · TRACK 2, FINANCIAL APPLICATIONS

PRIVATE ATOMIC DVP ON CANTON

LIVE ON CANTON DEVNET

\$66.7B

TRADED A DAY

in US corporate debt, against \$12.1 trillion outstanding.
Almost all of it negotiated one-to-one.

A BLOCK TRADE

moves the market the moment anyone
learns it happened

SO DESKS

negotiate bilaterally, off any public venue

AND THEN

someone still has to confirm the delivery

Source · SIFMA, US corporate bond statistics, Q2 2026 · [sifma.org/research/statistics/us-corporate-bonds-statistics](https://www.sifma.org/research/statistics/us-corporate-bonds-statistics)

Expose the trade, or hand a third party all of it.

ON A PUBLIC CHAIN

- Price, size and both counterparties are readable the moment it settles — often before.
- For a block, the **fact of the trade** is the leak.

OFF-CHAIN, THROUGH AN AGENT

- The settlement agent is handed the whole trade to confirm one fact.
- Payment and delivery are separate movements, reconciled afterwards.

Evidence that leakage is real · Tradeweb, “Information leakage in US credit: evidence from all-to-all RFQs”, 2026 (platform-operator research, indicative)

Now it has to settle — and whichever way they do that today, something has to give.

Every outsider reads the price, the size and both counterparties. For a block, **the fact of the trade is the leak.**

05 OR TELL THE SETTLEMENT AGENT EVERYTHING

The agent is handed the whole trade in order to confirm **one fact**: was the delivery reference valid?

Two movements in two systems, reconciled afterwards by hand.

Sup removes the choice.

A private offer to one named buyer. Both legs locked on the ledger. An agent that confirms a fingerprint and is told nothing else. Then one transaction that moves both sides, or neither.

Only the named buyer ever received the terms. Both legs are now **binding on the ledger**.

The agent's dashboard cannot show the price, because the price **never arrived**.

Both locked legs consumed, both deliveries created. **No half-settled state, nothing to reconcile.**

11 TWO INDEPENDENT REGISTRIES, ONE CODE PATH

Sup executes the registry's allocation and its own in the same transaction. **Neither registry knows Sup exists.**

PROPOSE	Seller sends private terms — only the named buyer receives the contract
ACCEPT	Buyer accepts — escrow opens
LOCK ASSET	Seller locks the bond — one transaction, now binding
LOCK PAYMENT	Buyer locks the cash, Canton Coin or CBTC — one transaction, now binding
VERIFY	Agent re-computes one reference — a trade id and a document hash, nothing else
SETTLE	Either principal settles — both deliveries commit in one transaction, or neither does

12 Daml templates · a portal per role (seller, buyer, optional agent) · per-trade proof read back from the node as the signed-in party

On a shared-state chain, “the agent shouldn’t see the price” is a request.

On Canton it is a property of the contract.

Visibility is declared in Daml as signatories and observers, and the protocol delivers a contract only to the parties on it. Every trade page lists its transactions, and **Verify** reads each one back from the node as the signed-in party. A party that was not on the trade is told: this transaction does not exist for you.

38 settled trades

on the shared HackCanton DevNet participant, not a local sandbox: 24 in the CashUSD test token, 4 in real Canton Coin, 10 in real CBTC

Real CBTC, one transaction

1220b7897407c4... · offset 2759757

BitSafe CBTC through the Digital Asset Utility registry

46 rejection checks

across 14 Daml scripts: wrong asset class, short quantity, a non-agent approving, an outsider settling, an approval from a different trade

Real Canton Coin, one transaction

12203a6f3f48c0... · offset 2705360

Amulet through the DSO registry, to a party with no wallet

4 live-ledger end-to-end suites pass on DevNet · **Not proven:** we have not interviewed settlement-operations teams, so we claim no savings

The operations team that already runs a confirmation step.

A broker, fund administrator or transfer agent settling institutional trades in tokenized funds, bonds or private credit.

THEY ALREADY

pay a named third party to confirm every delivery

THEIR CLIENTS

treat price and counterparty as confidential

AND THEY CARRY

the break-management cost of two settlements that can disagree

Not our user: retail traders, public order books, anyone who needs price discovery. Sup begins after two parties have agreed a price.

Wedge: replace the confirmation step for one desk, in one instrument.

0-3 MONTHS

Design partner

One administrator or broker and two counterparties it already settles for. Sup replaces the email-and-spreadsheet confirmation. A closed network — which is exactly how the contracts model it.

3-9 MONTHS

Agent pull

Every trade names a settlement agent. An agent that gets one workflow with zero commercial exposure has a reason to require it from its other clients.

9-18 MONTHS

Platform

More instruments, netting, multi-leg settlement, and registry integrations as real tokenized assets arrive on Canton.

Business model: a per-settlement fee, charged when the transaction commits — the only moment value is created.

A prototype, said plainly.

REAL

- Canton Coin and BitSafe CBTC, on DevNet, each through its own registry.
- Privacy and atomicity, enforced by the ledger and tested against it.
- Seven live parties on the shared DevNet participant, with on-chain custody accounts.

NOT REAL

- BOND-2031 and CashUSD are demo assets, not a security or cash.
- DevNet CC and CBTC have no market value; faucet amounts are tiny.
- Custodial demo wallet — no end-user signing yet.
- No legal title transfer, no production custody or compliance.

An external payment lock is defined by its registry: the sender can withdraw it. The seller's exposure is that settlement can fail, not that value is lost.

Settlement that proves delivery without exposing the trade.

One introduction: a tokenized-fund administrator or broker that settles institutional trades today, and a settlement agent willing to review exactly what it would see.

NEXT MILESTONE

per-party signing, so each party signs with its own key

IN 90 DAYS

one pilot counterparty pair, and 20 settlements that are not us
